

Experiences with different HP SFS/Lustre systems at KIT/SCC

Steinbuch Centre for Computing (SCC)
Roland Laifer

Overview

- Parallel file system basics
- HP SFS/Lustre systems at KIT/SCC
- SFS version 2 versus SFS G3
- Experiences with MSA2000
- General observations

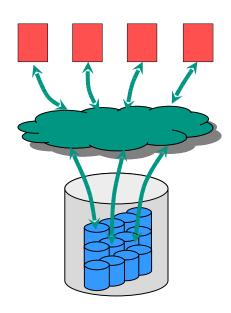

Forschungszentrum Karlsruhe

Parallel file system basics

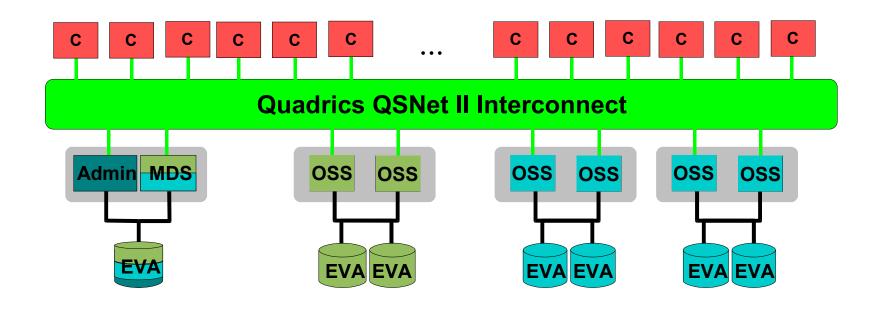

- What is a parallel file system?
 - Distributed file system with parallel data paths from clients to disks
 - No need for applications to be aware of these different paths
 - Applications on all clients typically see one consistent single namespace
- Why using a parallel file system?
 - Might be required if applications need any of these features:
 - Single namespace for 100's of clients
 - 10's of TB of data
 - Multiple GB/s throughput
 - 10's of millions of files

Itanium system (xc1)

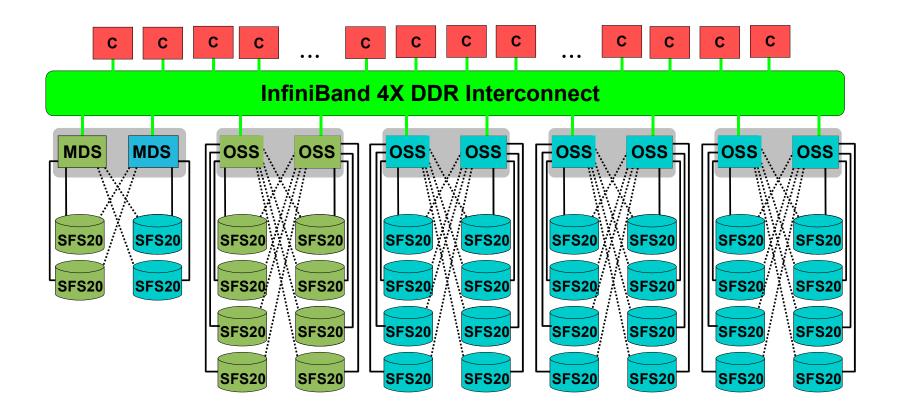

- HP SFS on xc1 runs extremely stable
- Good experiences with home directories in Lustre since 2005
- System will be replaced soon

Opteron system (xc2)

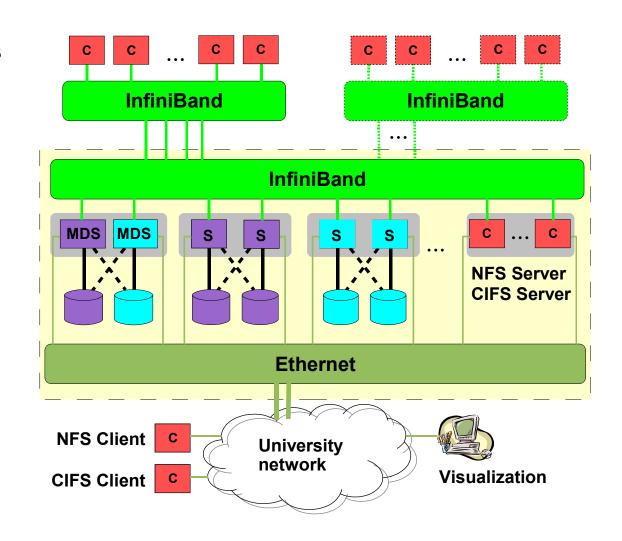

- HP SFS on xc2 runs very stable
- Very high I/O requirements of different applications

Central parallel file system (pfs)

- Additional clusters will be attached
- Virtual machines currently use NFS gateways

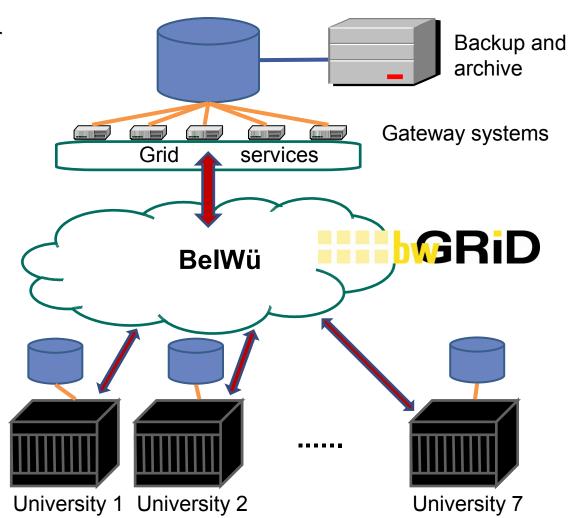

bwGRiD storage system (bwfs)

Grid middleware for user access and data exchange

Lustre systems at KIT

| System name | xc1 | xc2 | pfs | bwfs |
|-------------------|-------------------------|---------------------------|-----------------------------------|--------------------------------|
| Users | University of Karlsruhe | universities, industry | departments, multiple clusters | universities, grid communities |
| Lustre version | HP SFS 2.1-1 | HP SFS 2.1-1 | Lustre 1.6.4.3 | HP SFS G3.0-0 |
| # of clients | 120 | 762 | >200 | >1400 |
| # of file systems | 2 | 2 | 2 | 9 |
| Capacity (TB) | 3.8 + 7.6 | 16 + 48 | 73 + 304 | 4*32 + 3*64 + 128 + 256 |
| Throughput (GB/s) | 0.24 + 0.48 | 0.7 + 2.1 | 1.8 + 6.0 | 8*1.5 + 3.5 |
| Storage hardware | HP EVA5000 | HP SFS20 | transtec provigo | HP MSA2000 |
| # of enclosures | 14 | 36 | 62 | 138 |
| # of disks | 168 | 432 | 992 | 1656 |

SFS version 2 versus SFS G3

- Different strategy:
 - Version 2 uses old Lustre version with lots of backported patches
 - G3 uses newest Lustre version
- Advantages of SFS G3:
 - New features become available without delay
 - E.g. patchless client
 - No backporting by HP required
 - Fixing Lustre bugs can be forwarded to Sun
 - Better price (hopefully)

SFS version 2 versus SFS G3 (cont.)

- Current limitations of SFS G3 compared to version 2:
 - Stability has not improved
 - Increased management overhead:
 - No diskless installation of OSS
 - System database for easy migration no longer available
 - Currently missing features:
 - Monitoring and system check (sfsmgr syscheck)
 - Email alerts
 - Easy and enhanced file system check
 - Excellent documentation, e.g. for replacement of hardware parts
 - Preconfigured crashdump

Forschungszentrum Karlsruhe

Experiences with MSA2000

- Advantages compared to SFS20:
 - Improved performance
 - Higher capacity and hot spares
 - No single point of hardware failure and no batteries
- Current limitations:
 - Stability:
 - System might hang after a disk failure
 - Bugs required vdisk and OST recreation
 - Lots of recommended firmware upgrades
 - No good procedures for firmware upgrades:
 - Instructions not complete or changing
 - Each disk needs to be upgraded manually while system is offline

Forschungszentrum Karlsruhe

General observations

- Parallel file systems are the most critical cluster component
 - Underlying storage systems frequently cause most trouble
- I/O requirements often scale linearly with number of cores
 - Most applications are only scalable to some degree
 - Hence users are running different data sets in parallel
- Lustre provides a very good parallel file system
 - Software test including scalability by vendors is still required
 - Today most parallel file systems are Lustre installations
