- ADSM operational challenges
- Tivoli introduction
 - ➔ TME 10 framework
 - ➔ Management applications
 - ➔ Event automation
- ADSM Version 3 event management
- Tivoli Plus Module for ADSM
 - ➔ Client and server tasks
 - ➔ S/W distribution
 - ➔ Monitoring
 - ➔ Version 1.2 enhancements
- Server automation
- Summary

Multiple servers and 100's of clients

- ➔ Central control and administration
- ➔ S/W distribution and change management
- ➔ Resource monitoring
 - Client and server processes on multiple platforms
- ➔ Event monitoring
 - Scheduled client activity - local logs
 - Client errors - local logs
 - Server events - internal activity log
- ➔ Event automation
 - Client and server errors
 - Server operations

TME 10 Framework

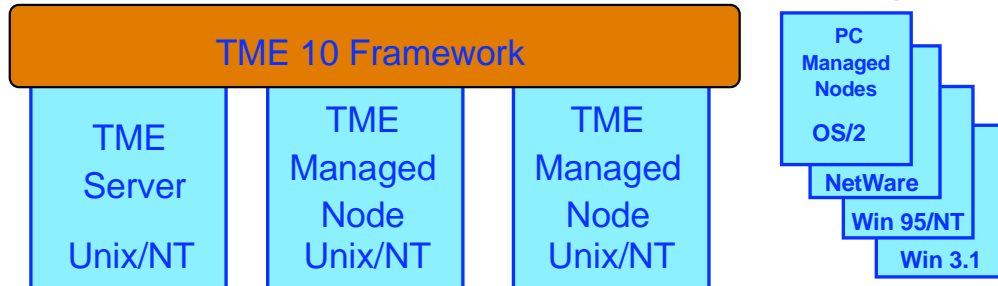

Object oriented systems management platform

- Run time environment for TME 10 services and applications
- Administrator interfaces
- Regions and management policies
- Management profiles
- Management by subscription
- Tasks, jobs, and schedules

Administrator Desktop

ADSM TME Tasks

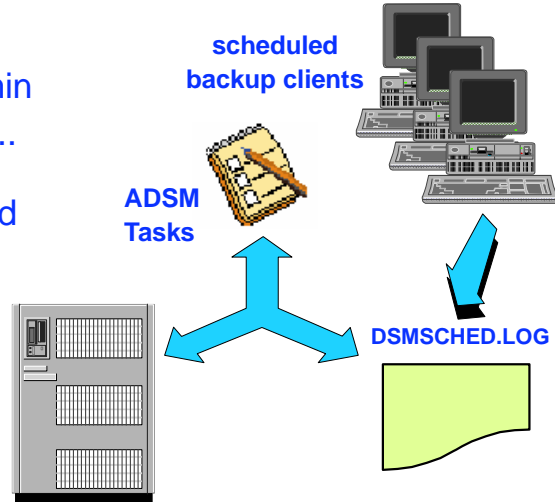

Useful for day-to-day admin tasks: running scripts, etc..

Managing client scheduled backup activity logs:

- ➔ Rename schedule log
- ➔ Transfer to admin system
- ➔ Delete original on client

Run on daily basis using TME scheduler

....
"hostname".SCHEDLOG."datetime"
....

TME 10 Management Applications

Sentry monitoring

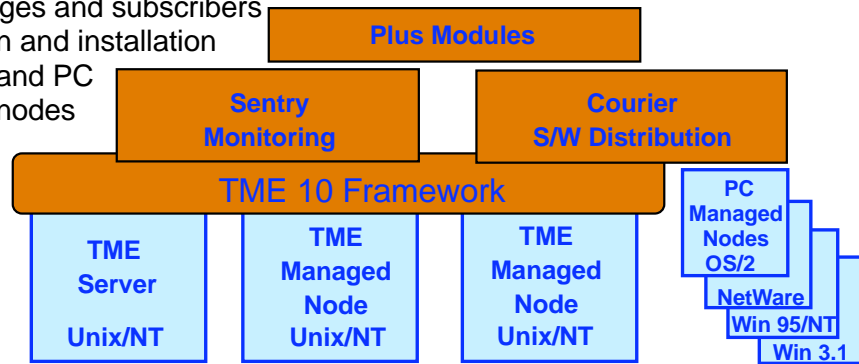

- Monitors and subscribers
- System resource monitoring
 - ▶ H/W, processes, etc.
- Managed nodes only

Plus modules

- Packaged management applications
- Application specific, i.e. ADSM
- Makes use of framework services and applications

Courier S/W distribution

- File packages and subscribers
- Distribution and installation
- Managed and PC managed nodes

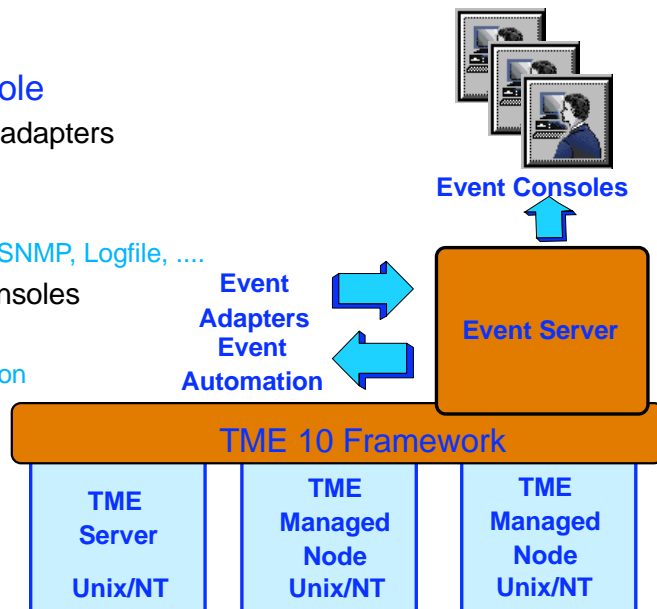

TME 10 Event Automation

Tivoli/Enterprise Console

- Event server, consoles, adapters
- Event integration
 - ▶ Event adapters
 - ▶ NetView, OpenView, NT, SNMP, Logfile,
- Notification to Event Consoles
- Event automation
 - ▶ Rules based task execution
 - ▶ Administrator defined

ADSM Version 3 Event Management

Client and server event logging and reporting

- Client error messages logged to server as events
- Client and server events can be routed to one or more configured event receivers
 - ▶ User and file exits
 - ▶ NetView for MVS
 - ▶ SNMP managers
 - ▶ Tivoli event adapter

ADSM Version 3 Tivoli Event Adapter

Native T/EC event adapter

- Integrated in Version 3 servers
- TME managed and non-managed platforms
- TCP/IP socket connection to Event Server
- Pre-defined event classes
 - ADSM server events
 - ADSM client events

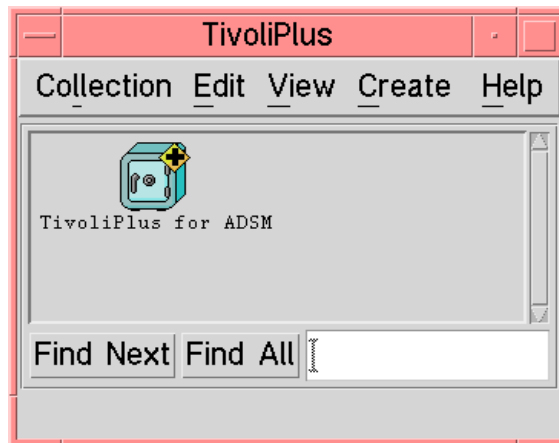

Tivoli Plus Module For ADSM

Framework products: Courier, Sentry, T/EC
and

Version 1.1 Plus Module

- Task library with ADSM admin and client tasks
- Profile managers for clients, servers, and monitors
- Courier file packages
- Sentry profiles and indicator collection
- T/EC logfile adapter for server console monitoring

Availability - Feb 1997

Plus Module Tasks

Packaged administrative and client commands

- Executed from Tivoli admin desktop on multiple managed nodes
- TLL based GUI dialog for underlying ADSM commands

Version 1.1 restrictions

- UNIX platforms only
- No interactive dialogs
- Admin commands are single server oriented
- Subset of ADSM Ver 2 admin commands

The image shows a screenshot of the 'DSMC Incremental Backup Options' dialog box. It contains several input fields and options:

- File System(s) To Backup:** A text field with a browse button.
- Backup Server:** A text field.
- Node Name:** A text field.
- Password:** A text field.
- Domain:** A text field.
- Tape Prompt?** Radio buttons for Yes (selected) and No.
- Display Messages?** Radio buttons for Yes (selected) and No.
- Date Format:** A dropdown menu showing 'MM/DD/YY'.
- Time Format:** A dropdown menu showing '23:00:00'.
- Number Format:** A dropdown menu showing '1,000.00'.
- Buttons:** 'OK', 'Cancel', and 'Help...' at the bottom.

Client Software Distribution

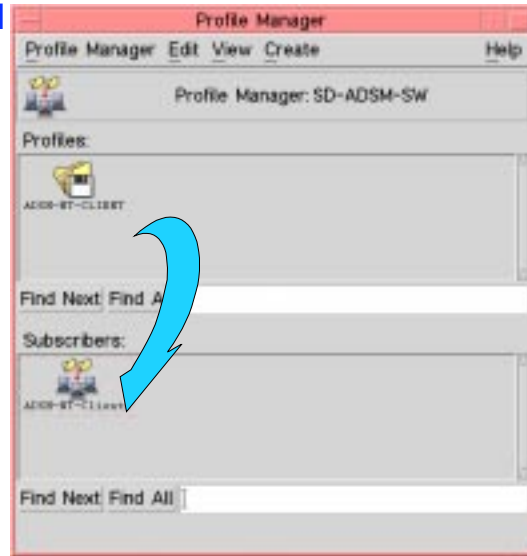

Courier file packages for ADSM client distribution

- Initial installation or updates
- Configuration files
- Scheduled distribution
- Before/After/Commit scripts for:
 - ▶ Checking available disk space
 - ▶ Automatic installation using "InstallShield silent" or Installp scripts
 - ▶ Stop and start scheduler service with "net stop" and "net start" commands

Ver 1.1 Plus Module provides basic file packages to which the following must be added

- User defined before/after scripts
- User configured client S/W

Client Monitoring with Sentry

ADSM Monitors

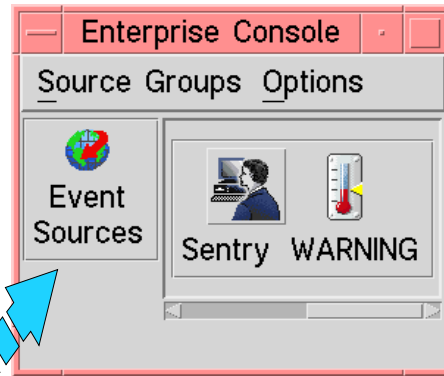

Version 1.1 Plus Module provides

- Sentry profile managers for ADSM 'Servers', 'Clients', 'Recall & Migration' with subscribers defined
- Two basic monitors defined
 - ▶ Host availability
 - ▶ network collisions
- Indicator collections

Other resources can be monitored

- Scheduled client processes
 - ▶ DSMC
 - ▶ DSMCSVC
- HSM client processes
 - ▶ DSMMONITORD
 - ▶ DSMRECALLD
- Client error logs
 - ▶ DSMERROR.LOG

and routed to T/EC for notification

Plus Module Server Monitoring

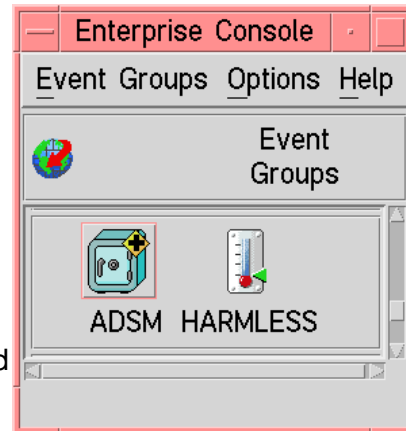

Version 1.1 Plus Module

- Icon for starting server and re-directing server output to file
- T/EC logfile adapter which monitors /var/spool/Tivoli/adsm.log
- Default rules base with multiple event correlation but no event automation

Logfile and T/EC configuration

- INITTAB for server start-up
- tecad_logfile.conf file for monitored logfiles
- For servers on non-managed nodes
run admin client in console mode
 - ▶ `DSMADMC -console ... >> /var/.../adsm.log`
- Each server must be monitored from a managed node with logfile adapter installed
- Configure event groups for multiple servers

Multiple Server Monitoring

Server Event Groups

Separate Event Groups for multiple logfile adapters

- AIX servers on managed nodes
- Admin clients on managed nodes for servers running on non TME managed platforms i.e. MVS, OS/400

The screenshot displays the Enterprise Console interface. On the left, a list of event groups is shown, including ACSM-pak, ACSM-yellow, ACSM-seven, and ACSM. Arrows point from the text 'Server Event Groups' and 'Separate Event Groups for multiple logfile adapters' to these groups. The main pane shows the details for the ACSM-pak event group, which has 258 entries. Below it, the ACSM-seven event group is shown with 4 entries. Both panes display a table of messages with columns for Class, Status, Subcode, Message, and Date.

Class	Status	Subcode	Message	Date
ACSM-pak	CRITICAL	0100	Session 95 ended for node Y0173 Mar 28	
ACSM-pak	CRITICAL	0100	Session 97 started for node Y0173 Mar 28	
ACSM-pak	CRITICAL	0100	Session 98 started for node Y0173 Mar 28	

Class	Status	Subcode	Message	Date
ACSM-seven	CRITICAL	0100	Session 126 started for node Y0173 Mar 28	
ACSM-seven	CRITICAL	0100	Session 127 started for node Y0173 Mar 28	
ACSM-seven	CRITICAL	0100	Session 128 started for node Y0173 Mar 28	
ACSM-seven	CRITICAL	0100	Session 129 started for node Y0173 Mar 28	

Version 1.2 ADSM Plus Module

Additional platform support

- AIX, HP-UX, Solaris, and NT ADSM servers
- UNIX, NT, 95, OS/2, and NetWare ADSM clients

New functions

- ADSM Version 3 compatibility
- Courier distribution scripts
 - ▶ Disk freespace
 - ▶ Automatic installation
- Sentry monitors
 - ▶ Database utilization
 - ▶ Recovery log utilization
 - ▶ New indicator collections
- Enhanced administrative security

Availability - Feb 98

Not implemented in Plus Module or with ADSM Version 3

- Multiple ADSM server platforms...
- Monitoring from multiple sources...
- Server resources are platform specific...

ADSM uses consistent message numbers on all platforms
T/EC GUI rules builder is simple to use and very powerful

Server automation examples using T/EC tasks

- ADSM server database running out of space
 - ▶ Run a task that defines temporary database volume on the server and extends the database
- Media error on tape in automated library
 - ▶ Run a task that performs a "move data" command to move data to other available volumes and mark the bad volume as unavailable

Summary

- ADSM Version 3 provides Tivoli event integration
- TME 10 applications and the Tivoli Plus module enables
 - Centralized operations
 - Distribution and installation of client software
 - Client and server monitoring
 - Server automation

The products provide the framework and tools
that have to be properly implemented and exploited
